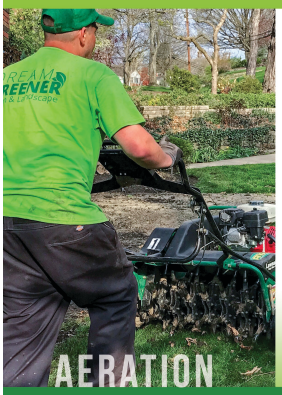
REVITALIZE YOUR LAWN

AERATION • OVERSEEDING • COMPOSTING



In Pittsburgh, our lawns are grown with a soil base that is mostly clay. Clay is dense, hard to manipulate with your hands and very compact. This tight and sticky clay can be rich in nutrients, but ONLY if your grass can make use of it.

This is why we recommend aerating every year.

- Allow grass roots to make better use of water & fertilizer
- Enhance circulation of air, water & nutrients deep into soil

- Reduce soil compaction & enhance air circulation
- Break down thatch layer
- Create optimal environment for overseeding

LAWN AERATION PROCESS

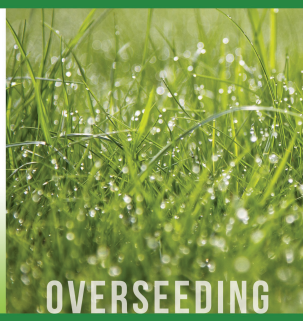
Core aeration is the process of taking small plugs out of densely compacted soil, turf and thatch. The plugs are then deposited on the surface. For best results, water thoroughly and mow the lawn prior to aerating. The tines on the aeration machine penetrate loose soil better than dry soil.

OVERSEEDING BENEFITS

When aeration is combined with overseeding, you can expect to strengthen and thicken up your lawn for the following season. The best defense against weeds, diseases, insects, and drought is a lush lawn.

OVERSEEDING PROCESS

Add premium blend grass seed at a rate of 3-5 pounds per 1,000 square feet.



BEST TYPES OF GRASS SEED FOR PITTSBURGH

Kentucky Bluegrass: Excellent color, density & texture

Fine Fescue: For heavy shade

Tall Fescue: Drought-tolerant, low-maintenance

Most seed takes two weeks to germinate and a few months to establish.

Fall lawn composting, also called lawn topdressing, is an eco-friendly process that incorporates a thin layer of rich, earthy, organic material to your lawn. This service aids in the immediate growth of new seed and adds important organic matter to clay soils.

LAWN COMPOSTING BENEFITS

- Enhances grass growth naturally
- Reduces required water requirements

- Kills and prevents disease over time
- Amends soil & introduces beneficial microorganisms
